TR series

REGENERATION OF INDUSTRIAL COMPONENTS

Description

 I forni pirolitici mod. TR da noi progettati e costruiti sono forni di nuova concezione che usano come principio di funzionamento il noto processo pirolitico. Sono forni ideali per: sverniciatura; rigenerazione di prodotti metallici; rigenerazione motori elettrici mediante termo rimozione delle resine isolanti.

 For.Tec. studied a heat process based on different stages that make it non-invasive and to protect products from deterioration. TR Pyrolytic ovens are suitable for: paint stripping; regeneration of metal products; removal of insulating resin from motors envelopments; motors regeneration with subsequent firing of resins.

 Les fours de pyrolyse modèle TR, conçus et fabriqués par nous, sont des fours de nouvelle conception qui utilisent par principe de fonctionnement le bien connu processus de pyrolyse. Ils sont appropriés pour: décapage des résidus dus à la mauvaise peinture, régénération de produits métalliques, décapage des accessoires de la cabine de peinture, élimination de la résine isolante des moteur.

 Die Pyrolyse-Öfen Modell TR, die von uns entworfen und hergestellt wurden, sind neu entwickelte Öfen die als Arbeitprinzip den bekannten Pyrolytischen Prozess verwenden. Geeignet für: Entfernung der Farbreste wegen der falschen Malerei, Regeneration von Metallprodukte, Farbentfernung von Werkzeugen, Entfernung von isolierenden Harz durch Wickelmotoren .

 Los hornos pirolíticos mod. TR, diseñados y construidos por nosotros, son hornos recientemente desarrollados que usan como principio operativo el conocido proceso pirolítico. Son hornos ideales para: despojo de la pintura con tratamiento térmico, regeneración de los productos de metal, despojo de pintura de accesorios de la cabina de pintura, regeneración de motores eléctricos a través de la eliminación térmica de resinas aislantes.

 Os forno pirolíticos mod. TR construídos por nós são fornos de nova concepção que utilizam o bem conhecido processo pirolítico como princípio de funcionamento. São fornos ideais para: remoção de verniz, regeneração de produtos metálicos, remoção de verniz dos acessórios de cabines de pintura, regeneração de motores elétricos mediante remoção térmica das resinas isolantes.

- (1) TREATMENT CHAMBER
- (2) BURNER'S FLAME
- (3) REFRACTORY TUNNEL
- (4) DOOR
- (5) LOADING CART BINARY
- (6) H₂O THERMOREGULATION SYSTEM
- (7) CONTROL PANEL
- (8) POSTCOMBUSTION CHAMBER
- (9) POSTCOMBUSTION BURNER
- (10) CHIMNEY

Process description

For.Tec. studied a new process, based on different stages, which uses the pyrolysis to remove paint, grease and other coatings from metal parts. The strengths of this new For.Tec. Technology are manifold:

- The use of heat under controlled conditions allows the complete decomposition of the coatings to be deleted without damaging or modify the characteristics of the treated metal parts and, at same time, assuring the best quality results;
- The optimization of the process by microprocessor control and the installation of a post-combustion chamber where fumes and odors are eliminated make this technology an environmental-friendly method;
- The injection during the cycle of nebulized liquid avoids the beginning of auto combustion episodes and allows the dross detachment, making the pyrolytic process the most safe and efficient;
- Thanks to the heat it is possible to deep clean metal parts even from hard to remove coatings and this therefore makes the treatment in pyrolytic oven more effective and quicker than the treatment in sand blasters or shot blasters; moreover the thermal stripping process is much cheaper than chemical stripping and other similar process.
